Titles of Most Frequently Occurring Classifications of Patents Returned

From A Search of 09731359 on January 14, 2002

4 375/222 (3 OR, 1 XR)

Class 375 : PULSE OR DIGITAL COMMUNICATIONS
375/219 TRANSCEIVERS
375/222 .Modems (data sets)

3 345/698 (2 OR, 1 XR)

Class 345 : COMPUTER GRAPHICS PROCESSING, OPERATOR
INTERFACE PROCESSING, AND SELECTIVE VISUAL
DISPLAY
SYSTEMS

345/204 DISPLAY DRIVING CONTROL CIRCUITRY
345/698 .Adjusting display pixel size or pixels per
given area (i.e., resolution)

3 370/463 (0 OR, 3 XR)

Class 370 : MULTIPLEX COMMUNICATIONS
370/431 CHANNEL ASSIGNMENT TECHNIQUES
370/463 .Details of circuit or interface for connectin

g
user to the network

3 370/524 (2 OR, 1 XR)

Class 370 : MULTIPLEX COMMUNICATIONS
370/473 ..Transmission of a single message having
multiple packets
370/498 .Combining or distributing information via tim
e
channels
370/522 ..Signaling (ancillary to main information)
370/524 ...Using a dedicated signaling channel (i.e.,
D-channel)

2 235/462.31 (1 OR, 1 XR)

Class 235 : REGISTERS
235/435 CODED RECORD SENSORS
235/439 .Particular sensor structure
235/454 ..Optical
235/462.01 ...Bar code
235/462.3Scanner power on/off
235/462.31Including object detection

2 235/462.45 (0 OR, 2 XR)

Class 235 : REGISTERS

09731359 CLSTITLES
 235/435 CODED RECORD SENSORS
 235/439 .Particular sensor structure
 235/454 ..Optical
 235/462.01 ...Bar code
 235/462.43Specified housing or mounting detail
 235/462.45Hand-held (e.g., portable)

2 369/47.12 (2 OR, 0 XR)
 Class 369 : DYNAMIC INFORMATION STORAGE OR RETRIEVAL
 369/47.1 CONTROL OF STORAGE OR RETRIEVAL OPERATION BY A
 CONTROL SIGNAL TO BE RECORDED OR REPRODUCE

D

369/47.12 .For copying

2 369/85 (0 OR, 2 XR)
 Class 369 : DYNAMIC INFORMATION STORAGE OR RETRIEVAL
 369/84 DUPLICATION OR COPYING (E.G., RERECORDING)
 369/85 .To diverse type of storage medium

2 370/527 (0 OR, 2 XR)
 Class 370 : MULTIPLEX COMMUNICATIONS
 370/473 ..Transmission of a single message having
 multiple packets
 370/498 .Combining or distributing information via tim
 e
 channels
 370/522 ..Signaling (ancillary to main information)
 370/527 ...Superimposed or modulated on principal
 information

2 370/529 (0 OR, 2 XR)
 Class 370 : MULTIPLEX COMMUNICATIONS
 370/473 ..Transmission of a single message having
 multiple packets
 370/498 .Combining or distributing information via tim
 e
 channels
 370/529 ..Information superimposed on other informatio

n

2 379/88.13 (1 OR, 1 XR)
 Class 379 : TELEPHONIC COMMUNICATIONS
 379/67.1 AUDIO MESSAGE STORAGE, RETRIEVAL, OR SYNTHESIS
 379/88.13 .Multimedia system (e.g., voice output combine
 d
 with fax, video, text, etc.)

09731359_CLSTITLES

2	380/276	(0 OR, 2 XR)	
	Class	380 :	CRYPTOGRAPHY
	380/255		COMMUNICATION SYSTEM USING CRYPTOGRAPHY
	380/275		.Speech scrambler detail
	380/276		..Including sampling
2	455/12.1	(0 OR, 2 XR)	
	Class	455 :	TELECOMMUNICATIONS
	455/7		CARRIER WAVE REPEATER OR RELAY SYSTEM (I.E., RETRANSMISSION OF SAME INFORMATION)
	455/11.1		.Portable or mobile repeater
	455/12.1		..Space satellite
2	707/503	(1 OR, 1 XR)	
	Class	707 :	DATA PROCESSING: DATABASE AND FILE MANAGEMENT, DATA STRUCTURES, OR DOCUMENT P
ROCESSING			
	707/500		DOCUMENT PROCESSING
	707/503		.Spreadsheet
2	707/504	(0 OR, 2 XR)	
	Class	707 :	DATA PROCESSING: DATABASE AND FILE MANAGEMENT, DATA STRUCTURES, OR DOCUMENT P
ROCESSING			
	707/500		DOCUMENT PROCESSING
	707/503		.Spreadsheet
	707/504		..Cell format control

F Data start sentinelthe accumulating step 54 (Figure 2), involves first accessing...

...data stream with the parser 36, at step 120. The parser then determines whether an **image** data boundary is detected, at step 122. If a new boundary is found, a new **image** data file is created, at step 124, and the header tagged, at step 126. The file **image** data is then entered, at step 128 until the end of the **image** boundary is detected, at step 130.

Once the end of the image boundary is found...and method. Additionally, the present invention provides the feature of managing and sequencing groups of **orders** for photofinishing services that result in an integrated image and audio product.

Total word count - documents A + B			9720

...SPECIFICATION on the film using a camera or other apparatus as mentioned above. At the selected **processor** -scanner station the user requests the type of **processing** and hardcopy **images** (for example, just negatives or additionally, reflective prints) desired and requests that an **image** set signal corresponding to the **image** set on film 48 be produced. These requests are made by checking appropriate boxes on a film **processing** envelope into which film 48 will be deposited, or can be magnetically recorded on film...

...to be read by reader 7 and further appropriate hardware/software. Film 48 will be **processed** (that is, chemically **processed** to yield a permanent **image** , which is sometimes references as "**developing** ") to generate a corresponding negative set 52 and a corresponding print set 50. Different negative...

...52 from different corresponding films 48, will be batched together with negative sets from other **orders** requesting the scanning service, and **images** on the **processed** films carrying magnetic data indicating those **images** are to be scanned, will be scanned using high volume scanner system 6. As described earlier, each scanner system 6 will generate from each negative set 52, a corresponding **digital image** set signal and will also generate an associated identification signal for each **image** set signal. The identification signal includes a unique scanner location identification as discussed above, and in more detail below. The **image** set signal can be in any suitable format that will be **acceptable** to hub station 20, such as TIFF, JFIF, BMP, PICT, GIF, PhotoCD or particularly the recently announced FlashPix format. The identification signal will be associated with a corresponding **image** set signal, along with the corresponding hub station address identification and category identification.

A FlashPix...

...SPECIFICATION DESCRIPTION OF THE INVENTION

Referring to Fig. 1, a system is represented diagrammatically from the **image** acquisition to the display of **digital** signals on a video display unit 39. A scene 31 is lit by a given...

...and converges the light-rays provided by a single point of the scene on the **picture** element thereof on a photographic carrier 33 situated in camera 32. The converged light exposes...

...as a function of the wavelength range, the photosensitive coatings of carrier 33. A latent **image** is formed thereby. Next, photographic carrier 34 is fed into a **processor** 35, in which the latent **image** is **developed**. After **processing** the latent **image** is visually perceptible as a colour negative **picture** on photographic carrier 34. Thereupon, the carrier is exposed in the digitiser to lamp 36...

...transparent carrier 37 and is filtered by the dyes, which are forming the visually perceptible **image**. In an optical path the light modulated by the dyes is passed through three filters...

...red filter 43 is described herein below, a similar description being applicable to the remaining **image** signals (green and blue). The red light, which is transmitted by this filter, reaches along...

...specified voltage range of the ADC. ADC 46 converts the analogue voltage signal into a **digital** signal r' with a fixed number of bits. In the state-of-the-art colour...

...so that 256 equidistant levels of $V(R)$ can be differentiated.

High-performance scanners for **graphic** art applications are currently equipped with an ADC generating twelve (as illustrated on the figure...

...adjustability of G and V_0) is generally not required, because a window may be selected **digitally** from the available levels later on. In the case of systems with an eight-bit...

...usually adjustable, depending on the density range of the carrier to be scanned.

Currently, the **image** will be scanned twice, once during the pre-scan step and once during the final...

...a system, in which the ADC generates a sufficient number of bits, the broadest possible **digital** window is chosen during the pre-scan. The pre-scan is determining the size of...

...with the specified input voltage of the ADC. As will be explained herein below, the **image** signals obtained from the pre-scan determine the values of G and V0)), which are specific for the **image** .

The FOCUS COLOR (trademark of Agfa-Gevaert N.V.) scanner manufactured and **distributed** by Agfa-Gevaert N.V., Mortsel, is an eight-bit colour scanner, in which the...

...time. The HORIZON (trademark of Agfa-Gevaert N.V.) scanner also a system manufactured and **distributed** by Agfa-Gevaert N.V., Mortsel, is a system with a nine-bit ADC, also...

...TR)), TG)) and TB)) as a result of which densities below the lowest in the **image** and above the highest are not further **processed** . In the ACS 100, a high-performance scanner for **graphic** art applications of Agfa-Gevaert N.V., is equipped with a thirteen-bit ADC and exhibits a variable integration time due to optical enlargements of the original **image** . The tone curve of said scanner **accepts** thirteen bit as input which is sufficient for the system's supplying an eight-bit...

...obtained from the ADC - is converted by means of the tone curve TR)) into a **digital** (corrected) red colour value r. The way of proceeding and drafting the tone curve TR...

...for red, green and blue, convert the pixel values r', g' and b' of a **digital** representation of the negative **picture** into a **digital** representation of the positive **picture** with pixel values r, g and b.

If the **digital** colour value g for green and colour value b for blue have been obtained in a similar way, the **image** signals are already suitable for the true-colour rendering of neutral tones in the scene as well as very suitable for supplying **images** that can be further manipulated in an interactive way for use in colour applications, such...

...PHOTOSHOP (trademark of Adobe Inc.). Furthermore, a correction of colour shifts resulting from the photographic **process** is usually required. This is achieved by combining the colour values r, g and b...

...display unit 39 controlled in response to these R, G, B signals will reproduce an **image** that is, within the limits of the colour gamut of the display unit, a reproduction of true colour of the scene. Consequently, such **images** are very suitable as a base for reproducing reproductions of the original scene.

Referring to...

...analogue gain G and the reference voltage V0)) or of determining the limits for the **digital** window. A pre-scan step is intended for determining the density range of the **image** carrier. To that end, the scan should cover the full density range, which is varying...

...D, the ACS 100 of 0-3 D. Matched with the density range of the **image** to be digitised the dynamic range can be curtailed by adjusting the integration time for...

...optical path and by judiciously selecting the gain G in the analogue electrical path.

In **order** to determine the density range of the **image** to be digitised, for each of the colour components the minimum and maximum densities in the **image** have to be found. In the art the minimum density tones are called the highlights...

...density tones are called the shadows. They may be found by e.g. an interactive **process** or by analysing an histogram for each of the colour components.

The interactive **process** requires that the user marks the 'white point' in the scene. On the colour negative **picture** obtained from the pre-scan, it corresponds to the darkest point on the **image**. The user moves a mark on the screen to that point on the **image** and informs the system that the selected point is the 'white point'. As a result...

...effect of such scanning problems may be neutralised by using noise suppression procedures.

For the **image** signals derived from the red colour component the minimum density denoted on Fig. 2 by...

...maximum density DMR)) are obtained. The same applies to respectively DmG)) and DMG)) for the **image** signals derived from the green separation **image** and DmB)) and DMB)) derived from the blue separation **image**.

In scanners equipped with but an eight-bit ADC an optimum setting of the gain...

...the analogue circuit is advantageous so that an optimum use can be made of the **digital** capacity for the colour values for representing useful densities, i.e. densities that are actually found within the density range of the **image** to be digitised, avoiding thereby that colour values would be associated to densities that are not occurring in the **image**.

Upon setting G and V0)) the occurrence of an unwanted colour shift should be avoided...

...a setting for the gain G will have an adverse effect. Indeed, if the scanned **image** is obtained partly from a fully transparent area on, or next to the **image** carrier, some CCD elements may reach a supersaturated state and give rise to an effect...

...will also reach a saturated state without apparent cause for such effect in the scanned **image** on that particular location.

The specific setting of G and V0)) is aiming at representing...

...this way, it can be achieved that in, e.g., an eight-bit system a **picture** element of the darkest neutral point in the scene will be **imaged** on the pixel value $(r', g', b') = (255, 255, 255)$ and the lightest neutral point...

...rise to the pixel value $(0, 0, 0)$. In case of a system with a **digital** window function, $r'mR))$ and $r'MR))$ corresponding to respectively $D'mR))$ and $D'MR))$.

...planes, i.e. the set of colour values for one single colour component on the **image**, a tone curve is determined respectively $TR))$, $TG))$ and $TB))$. Tone curve $TR))$ transforms the electrical colour value r' into a **digital** colour value r . In a similar way, g is derived from g' by means of...

...in a way that for all neutral tones in the scene not only the three **digital** colour values r , g and b have a common **digital** colour value k , i.e. $k = r = g = b$, but that there is also a...

...between the luminance $LV))$ of a neutral tone in the scene and the corresponding common **digital** colour value k : The constants s and t can be calculated explicitly by substituting the...

...table $TR))$ (look-up table or LUT) transforming the electrical colour value r' into the **digital** colour value r is explained. To that end, for every possible value r' the corresponding...for s and t by solving the linear system (1a, 1b). A value for the **digital** red colour value r is obtained, which is corresponding to the electrical red colour value...

...preferably a value r of $r = r_{max}))$ is adopted. The latter two conditions implement the **digital** window function.

The steps for calculating r from r' are performed for each of the...

...the ADC, can be utilised as an index in the LUT defining TR) and the **digital** colour value r will result immediately from the indexing step. The tone curve TR) may...

...according to a similar procedure as described for TR)

The transformation need not be performed **digitally**. It is conceivable that it is performed by means of electronic circuits on analogue electrical colour values r' , g' and b' , whereupon an ADC immediately provides the **digital** colour values r , g and b that are linearly related to LV)

It is furthermore...

...the function g in r' , the further procedure being similar to the above description.

The **digital** pixel values r , g , b are a faithful reproduction of the luminance of points of...

...explained further herein below. First, the conversion of electrical colour values r' , g' , b' into **digital** colour values r , g , b and their further transformation into colour-corrected colour values R ...
... LV) by taking the antilogarithm, it is advantageous to transform $\log(LV)$ linearly to the **digital** colour value, e.g. r . An optimum use of the available **digital** capacity, e.g. 256 values in case of an eight-bit **digital** colour value, can be provided by imaging $\log(Lm)$ on 0 and $\log(LM)$ on...neutral tones in the scene. A similar statement applies to TG) and TB). Next, the **digital** pixel values r , g , b can be transformed to colour-corrected pixel values respectively R ...

...proportional to $\log(LV)$ and the result R' , G' and B' should meet a given **digital** capacity (e.g. 0,255) as close as possible.

The so obtained colour-corrected colour...

...are selected again in a way that an optimum use is made of the **digital** capacity for R , G and B . Consequently, a grey swatch in the scene with luminance...

...on the x-axis of the film curve is proportional to the luminance of the **imaged** point of the scene LV) on the x-axis of the system curve. The proportionality...

...arbitrarily, since it will be eliminated by the linear transformations optimising the use of the **digital** capacity. Furthermore, the optical density on the y-axis of the characteristic film curve and...

...at fog level D_{fog}), i.e. the optical density measured on a strip of unexposed **processed** film. As the value measured may vary for all three colour components, distinction is made between D_{fogR}), D_{fogG}) and D_{fogB}). On a strip unexposed **processed** film, e.g. on the area between two recordings, the colour densities D_fR), D_fG) and...

...will determine to which extent the characteristic film curve has to be shifted downwards, in **order** to be an approximation of the characteristic system curve. If the film curve is given...

...the difference as stated above. In this way, a characteristic system curve suitable for the **process** of the present invention may be obtained from the characteristic film curve. The determination of...

...effected on the occasion of the pre-scan. The actual digitisation of the colour negative **picture** is thus preceded by a short calibrating step

determining the optimum scanner settings (gain G and reference voltage V0)) or **digital** window function based on the density range and derived subject brightness range) as well as...

- ...material. There is no need for having the disposal of a full characteristic curve in **graphic** form or in tabular form, nor for measuring the optical densities at fog level. In...
- ...of the scanner type that will be used for the digitisation of the colour negative **pictures** . In a standardised environment a test target is photographed on the negative material to be characterised.

The latent **image** is **developed** and the obtained **developed** colour negative **picture** is scanned on the scanner to be characterised. For a number of points on the negative **image** , with a neutral tone in the scene, the luminance LV)) in the ...a colour temperature of 5000 K. The IT8.7/2 reference target is a colour **image** defined by IT8 SC4, i.e. Subcommittee 4 (Color) of ANSI Committee IT8 (**Digital** Data Exchange Standards). It is particularly suitable for reflective **image** carriers. The full reference target is composed of separate swatches, each of a distinct grey...

- ...7/2 copy by measurement on a densitometer. The reference target is photographed by a **camera** containing the negative **film** material. The diaphragm and the distance to the scene, formed by the reference target, are...
- ...latter doubles, the exposure on the negative material will double as well. By using this **process** , the subject brightness range of the reference target can be virtually extended. The film is **developed** and the **image** corresponding to a single selected standard shutter time is digitised by the scanner. For each...
- ...photosensitive member. The negative logarithm of this exposure, e.g. DR)) for the red separation **image** , is plotted on the y-axis, and the logarithm of the luminance log(LV)) of...
- ...on the graph. The number of measured points can be increased by digitising also the **image** obtained with a doubled shutter time. In that case, a luminance that is two times...
- ...the standard shutter time is allocated to the grey swatch in the scene. A similar **process** can be applied, if need be, at half a shutter time and still further shutter...
- ...absence of salient points.

According to this method, however, if the measured points are irregularly **distributed** , e.g. due to measuring errors, the curve joining the measured points will show an...

... been a slow mover since R&D began a decade ago is the electronic still-picture camera. But it has now taken a big step forward with the development of the first truly digital camera by Toshiba Corp. and Fuji Photo Film Co. The camera records images as digital data on a 4-megabit electrically erasable programmable read-only memory (EEPROM) chip. Existing electronic cameras, such as Sony Corp.'s Mavica, take an analog signal and store the image data on a floppy disk. The digital camera has a resolution of 400 horizontal lines, much better than the 300 lines achieved by analog models. Current work aims at refining the 16:1 signal compression technology and developing a 200-megabit storage card. Several years of work are still ahead before such digital images come close to achieving the photo quality of conventional film.

ASICS Mixed-signal application-specific integrated...

High Speed Photographs craved in CD-ROM.

ABSTRACT: In order to reduce a time required for image processing and analyzing, we have built up the system which consists of personal computer system, two kinds of image scanner and CD-R. A series of image recorded on the film by high speed camera are converted into digital image data on the CD-R media by various types of image format. After this, they are used through image processing, for example, finding out .GAMMA.-value, brightness and contrast to obtain the best quality of picture, detection of profile and finally printing the picture. Title: IMAGE- PROCESSING OF EXPLOSIVE ACTIVITY AT STROMBOLI

...Abstract: behaviour at different vents of Stromboli volcano is proposed.

The method is based on computer processing of images taken by an infrared film camera , at a rate of 4 pictures per second. Each picture has been digitized by use of an image scanner with a 75 d.p.i. (dots per inch) resolution and 256 levels of gray, then processed and the total mass of the ejected material has been calculated for each photograph . With this procedure the flux of ejected matter throughout every single explosive event has been...

...ejecta has allowed us to evaluate the ejection velocity. The mode of the mass flux distribution and the mean value of the velocities calculated for individual particles quantify the kinetic energy...

...1985-86, show several explosive patterns, the energy of which is measured. The observed flux distributions have been checked both numerically and experimentally by modelling impulsive events.

The computer simulations of the mass distributions have allowed

us to speculate on the possible explosive dynamisms. Two different models have been...

...had the opportunity to test the overall resolution of the method.

The observed matter flux distribution has then been associated to the seismic signals in order to correlate the dynamics involved...

Tomography in image diagnosis of the lung.

...ABSTRACT: chest radiography. In this article we will first discuss the methodology, concentrating especially on the **digital** tomosynthesis

system which is being developed at our institution, and will then present a preliminary report concerning clinical applications. Using this technique, the patient dose can be greatly reduced and the X-ray image data can be more effectively utilized by employing post-processing. This system is also applicable to digital angiogram, and may have a wider range of applications when a larger image intensifier(II) and a higher resolution TV camera are made available. Our system consists fundamentally of a conventional X-ray fluorographic TV unit provided with a tomographic function, an image processing unit, and a laser camera. The tomographic unit moves linearly, with an angular swing of 40.DEG.. When this unit is utilized for digital tomosynthesis, 30 fluorographic images from different angles are obtained during a single linear pass. These images are received by a high-resolution TV camera via an II, are digitized by a...

...reconstruct tomographic slices at any desired level at the rate of 1.2 seconds per image, and these images are then displayed on the CRT or transferred to X-ray film using the laser camera. (abridged author abst.)

CAMERA AND FILM FOR RECORDING OVERLAPPED IMAGE

ABSTRACT

PROBLEM TO BE SOLVED: To **record** video information and **digital** information in the same area of film by providing overlapped exposed visible and non-visible sensitive recording layers in the film.

SOLUTION: In **order** to expose a film recording layer where sensitivity is given to visible light with visible...

... exposure gate 41 with light from a video. Then the camera is equipped with a **receiver** 38 and a sound recording microphone so as to **receive** digital data from an external source type such as an infrared signal source 32, a...

... part 36. The signal from one of them is selected by a selection switch 39, **processed** by a semiconductor **processing** circuit 40 and stored in a data buffer 42. When a recording data button is...

Color negative photographic element with enhanced speed of developing red and green color layer

Abstract (Basic):

- ... Hydrophilic colloid layers contains at least 2 layers each of red, green, blue recording dye **image** -forming layers differing in their speed...
- ...An INDEPENDENT CLAIM is also included for the **process** of producing multicolor dye **image** in which **developing** of color photo **graphic** element is performed in less than 2 minutes...
- ...For **digital** color record , and in camera speed films having ISO (International Standard Organization) ratings of 10-2000 or 100-2000...
- ...The **development** of the color **image** is complete within 2 minutes. The contamination in the **image** can be eliminated or reduced with an aid of **digital** color record . Any portion of red, green and blue characteristic curve above the minimum density can be adjusted by electronic manipulation. The speed of **developing** can be achieved without decreasing the **image** quality. As transparent support is used in color negative photographic element, the amount of dye...
- ...dyes in the different recording layer units has half the absorption bandwidth without overlapping in **order** to simplify scanning. The color balance of the **image** can be achieved under tungsten illumination for day light or flash exposure...

Technology Focus:

- ... red, green and blue. The color negative photographic element do not contain masking couplers and **development** inhibitor couplers in **order** to facilitate effective scanning. Preferred Layers: On the faster speed blue recording layer, fastest red...
- ...Preferred Time: The multicolor **image** is produced by **developing** the color negative photographic element in less than 1 minute or within 30 seconds.
- Extension Abstract:
- ... support to obtain type A material. The material was exposed to an Eastman sensitometer and **processed** with KODAK FLEXICOLOR. The time for **development** of the film was found to be 20 seconds.
- ...Title Terms: **PHOTOGRAPH** ;

Image file generating method for recording digital image from film, digital camera - ...

...involves generating image data for printing by interpolation processing original image obtained by image generating apparatus, then generating image data sets at different resolutions

...Abstract (Basic): The image file generating method involves generating the image data (9) for printing in order to generate photographic print (5). This is achieved by carrying out interpolation processing by an interpolation processing system (13a) on an original image (8) obtained by an image generating apparatus e.g. a card reader (10), or film scanner (11). The interpolation processing system is an image printing data generating system...

...Image data sets (7a,7b) at different resolutions are also generated by directly carrying out interpolation processing by an interpolation processing system (13b) on the original image. The interpolation processing system is a stepping resolution image data set generating system...

...USE - For recording digital image obtained from film or digital camera as image file in recording medium such as CD-R and an MO disc...

...ADVANTAGE - Minimises image quality degradation due to enlargement or reduction of digital image.

Video monitoring system e.g. for movie film camera - ...

...has video camera positioned in film camera to receive image directly form camera lens without interposing either ground glass for imaging or optical deanamorphosing lens with anamorphic image horizontally squeezed

...Abstract (Basic): The system supplies an anamorphic image from a reflective shutter to a video camera, and a signal processor receives and processes a digital video signal from the video camera, the signal processor produces a processed signal for the video monitor in a deanamorphosed form where portions of a screen of the video monitor omit all of the anamorphic image and another portion of the screen of the video monitor displays a deanamorphosed image of less height than the anamorphic image but of the same width as the anamorphic image . The signal processor includes interpolation processor which averages the video signal by taking a line-by-line input of the video...

...the video signal is identified by consecutive odd numerals for a field including the anamorphic image , an interleaved line-by-line signal identified by consecutive odd numerals is developed by the processor by averaging next odd numbered lines, and the processed video signal is produced by averaging the odd and even lines and selecting alternate lines to produce the processed video signal for the deanamorphosed image .

...

...ADVANTAGE - Uses standard video camera and standard video monitors with system deanamorphoses image displayed on video monitor when

anamorphic lenses ~~are~~ used in film camera .

**Selective image compression for film-less digital camera
capturing set number of images with CCD...**

...dividing image digital data into discrete blocks, compressing blocks
e.g. using DCT, determining image quality w.r.t. compression and
applying other compression if quality is unacceptable

...Abstract (Basic): A film-less digital camera may have a stated
image storage capacity for a designated number of images, e.g.
thirty-two black and white images. The image data is generated as
analog data and converted into digital data. Data representing one
complete image, are divided into small discrete blocks. Each block is
compressed using a standard compression method...

...data block is then examined and a determination made of the quality of a
compressed image. If the quality falls below a preset standard, the
data block is compressed by an...

...blocks that meet the quality requirement are recorded by the first
compression method without further processing.

...
...Each block of data is coded to indicate the method by which it is
compressed. After compression of the entire image, a computation is
made of the memory storage capacity required for the image. If the
required memory is appreciably less than the amount allocated for each
image, the compression parameters are adjusted and the image
compressed again. When the memory requirement falls within the
established tolerance, the image is recorded. Each data block is
encoded to indicate the method by which it was

- ... uses microprocessor to control analogue-to- digital conversion of audio signal with temporary storage prior to impressing on magnetic layer on film.
- ...Abstract (Basic): a built-in microphone (17), an internally mounted microchip which converts analog audio signals into **digital** signals for recording onto the film, a magnetic recording head and a speaker (20) which permits playback and editing. A photo-finishing appts. reads the **digital** audio signal and converts it into a predetermined encoding format which is impressed onto the...
- ...The microphone and speaker are connected to an analog amplifier and data **processing** circuit (24). A sound **processor** IC (15) converts the analog signals to **digital** for temporary storage in a memory (26) prior to recording on the magnetic layer on...
- ...compact audio recording system for use with negative or positive film at the time of **picture** taking without separation from the photographic **image** .
- ...Abstract (Equivalent): Photographic system with audio recording and playback comprised of a photographic **film camera** (16) adapted to receive film (10) having a magnetic recording layer (13) thereon, said camera...
- ...audio transducer (17) and signal conversion means (24,25) for converting audible sound to a **digital** signal, temporary storage means (26) for storing said **digital** audio signal in the camera and magnetic recording means (27) for recording said stored **digital** signal on said film magnetic recording layer; and photofinishing apparatus for producing photographic prints from latent **images** exposed onto said **film** in the **camera** , said photofinishing apparatus including magnetic read means (40,41) for reading the **digital** audio signal recorded on the film magnetic layer, means (42) for converting said read **digital** audio signal into a predetermined encodement format and means (43) for impressing said encodement format...
- ...56,56a,56b) adapted to scan said encodement format on said photographic prints to generate **digital** audio data signals for storage in said memory and for subsequent playback independently of said...
- ...Abstract (Equivalent): In the photographic film system, audio to be recorded in a photographic **film camera** in association with individual exposed frames is first digitised and stored in a temporary storage...
- ...needed. When the film is advanced in the camera to the next exposure frame, the **digital** audio signal is recorded on a magnetic layer formed on the film...
- ...At he photofinisher, the **digital** audio signal is read and converted to suitable encodement format, such as bar code or binary **coded** blister marks which are impressed on the photoprint for subsequent playback...
- ...ADVANTAGE - Sound recording does not become separate from **image** . Not limited to use with instant print cameras...

Recovering coded signals from film sound track or video tape...

...reshaping signals into digital form by amplifier circuit eliminating DC effects for playback or re-recording

...Abstract (Basic): A cine camera film has an additional track of optical marking in parallel the perforations along the edge of...

...code strip is read (10) and the generated output is distorted (B) from the ideal digital pulse sequence. The signal is processed by an amplifier circuit (11) that eliminates the d.c...

...component and reshapes the signal into the ideal digital form (C) for recording or display (12). The amplifier uses peak value detection and level triggering. ADVANTAGE - Eliminates distortion effects from digital signal waveform...

...Abstract (Equivalent): The method described has been designed for a coded signal sequence consisting of optical marks (time codes) which have been recorded on a moving optical medium (1), such as motion picture film, and which are composed of frequency-modulated alternating voltage signals. The direct voltage component contained in the coded sequence is eliminated and the alternating voltage signal is digitalised to form a rectangular output signal sequence. The triggering threshold for digitalising the alternating voltage signal is shifted by a certain amount formed by multiplying the difference...

Digital image processing method for photographic image in exposed

photographic film roll

Abstract (Basic):

... A visual print order from a predetermined location, is received by an image server (16) corresponding to the stored digital images in another predetermined location to produce and distribute the visual print based on the facilitation of selective authorized access using an authorization code.

... The method involves scanning the exposed photographic film roll to obtain digital images corresponding to the photographic images . An authorization code is assigned to the digital images .

...

...For photographic image in e.g. exposed photographic film roll, digital camera .

...

...Ensures easy and economical processing of digital images .

...

...The figure shows the block diagram of a digital image processing method...

EDITED BY PAUL M. ENG

TEXT:

Everyone knows that a **picture** is worth a thousand words, but incorporating one into a computer document can be more trouble than it's worth. After taking the **picture** using an ordinary **camera**, the **film** must be **developed**, printed, and then digitized into the computer using a scanner. But Fremont (Calif.)-based Logitech Inc. may soon make it a snap for desktop publishers to add **images** with a new **digital** camera.

FotoMan works much like an ordinary camera, but there's no film to develop

TEXT:

...A., 1999 FEB 18 (NB) -- By Matt Hines, Newsbytes. Philips Electronics and Eastman Kodak subsidiary PictureVision Inc. have established a new partnership aimed at delivering online digital photo applications over the television. Under the agreement, Philips will offer Kodak's PhotoNet online image service along with several of its set-top devices which let users view the Internet on traditional TVs. The PhotoNet service allows users to view, share and store photos, as well as order image reprints and enlargements, via the Internet. "This agreement supports two growing trends -- online interactive television and digital photography," said Adrian Turner, director of Internet business development at Philips Electronics. "As a consumer platform, the television represents a natural vehicle for the display of digital photographs." As part of the new relationship, PictureVision will develop a TV-based version of PhotoNet and Philips will make the service available on devices including its WebTV-based Internet Receiver which offers wireless access to a PC via the television. The two firms officially announced...

...The partners indicated that over three million camcorders with the interface have already been sold. PictureVision is an independently operated subsidiary of Eastman Kodak which focuses primarily on the digital photography services sector. PictureVision's Web site is located at <http://www.picturevision.com> Philips can be found online at <http://www.phillips.com> Reported By Newsbytes News...

TEXT:

...An Eastman Kodak [NYSE:EK] official has confirmed to Newsbytes that its "You've Got Pictures" digital photo processing initiative it planned to launch with America Online Inc. [NYSE:AOL] did...

...Charlie Smith told Newsbytes complications in the system expected to deliver the You've Got **Pictures** service is causing the delay. "We just wanted to do it right, and take the...

...both our customers and our retailers," Smith said. Original plans called for You've Got **Pictures** to roll out sometime in the fourth quarter of 1998 (Newsbytes, May 19, 1998). Now...

...service is expected to debut in the summer of 1999, Smith said. You've Got **Pictures** will enter a beta test stage "soon," Smith said, although he did not say when...

...When both AOL and Kodak announced the service last year, officials said "You've Got **Pictures** " would allow AOL members to have **images** from their developed film sent digitally for an additional \$5 to \$7 per roll (Newsbytes, May 19, 1998). Users of the new service will still pay for and **receive** regular prints, but they will also **receive** digital "contact sheets" of the same **photos** in their AOL photo mailbox. At the time, an AOL official said You've Got **Pictures** is a part of the world's largest online service's overall imaging strategy. "Imaging...

...see this as a means to offer our users an easy way to deal with **photos** without having to worry about where to download them, what format to use or any other complications. The whole idea is to make **photos** as easy to use as e-mail." The three-year agreement calls for Kodak, AOL...

...imaging site, <http://www.photonet.com> . Currently, the site allows Internet users to have digital **images** from developed film electronically mailed. PhotoNet became a property of Kodak when the company acquired **PictureVision** Inc., and turned the Washington, DC-area company into a Kodak subsidiary. ABSTRACT:

Toshiba (Tokyo, Japan) has developed a digital camera with an 18-bit memory card and better optics than earlier versions. The 1.2-kg IMC-200 has a frame-interline-transfer CCD image sensor and features proprietary photograph compression. The reuseable memory card for as many as 12 images needs a built-in battery, but a model expected in 1995 will eliminate that requirement...

...printing, among others. Using an ISDN line at 64-kbits/s, a 1.5-Mbit image file can be transmitted in 25-sec, vs 10-min via a standard 2400-baud modem. The firm is developing interfaces with Macintosh and IBM-compatible computers for the digital cameras. Canon (Tokyo, Japan) has also developed a film-less camera, based on analog technology. The XAPSHOT, debuted in 2/91, weighs 420-g and contains an erasable and re-recordable floppy disk that can accomodate up to 50 images. A completely charged camera is said to be useful for as many as 800 images, and is much less expensive than the Toshiba system, though some think the technology will be replaced by digital versions within-10 yrs. Other companies developing film-less cameras include Olympus, Konica, Sony, and Chinon. Fuji Film was involved in Toshiba's development work. Article includes figures. ...

Document Type: Newspaper; General Trade

ABSTRACT:

Fuji Photo Film (Japan) and Zoran (Santa Clara, CA) have jointly **developed** an IC that will be used in a new **digital** still camera to be introduced by Fuji. **Digital** still cameras use an IC memory card rather than film, and because of this, the **pictures** they take can be **processed** easily by a personal computer. The new IC is based on Fuji's special **image processing** algorithms and Zoran's design technology. It consumes considerably less power than conventional equivalents, and compresses **image** data to a small fraction of its original size. Fuji Photo subsidiary FujiFilm Microdevices will produce and sell the new IC from 5/91. Fujix, another subsidiary, will make the **digital** still **camera**. Fuji Photo

Film claims the new IC could also have applications in ISDN systems and personal computers.

Das Foto-CD-System soll fuer weitere Impulse sorgen
Handelsblatt, p20
Oct 9, 1990
Language: German; NONENGLISH Record Type: Abstract
Document Type: Magazine/Journal; Trade

ABSTRACT:

Kodak (Stuttgart, Germany), **camera** , **film** and printing firm, and Philips (Germany), electronics firm, have together **developed** the Photo-CD system to be introduced on to the market in 1992. The system will store **photographs** electronically, thus offering an alternative to prints and slides. The Photo-CD system works by **digitally** scanning negatives or slides and resolving them into 18k pixels. The data is then compressed...

...a CD by means of a laser beam. The CDs can store up to 100 **photos** , which can be recalled on a TV set or printer with the use of a special CD player currently being **developed** by Philips. The new product should ensure the continued growth of Kodak's photo sector.

Camera uses E2PROM film
Electronic Engineering Times April 10, 1989 p. 45,53
ISSN: 0192-1541

Fuji Photo Film and Toshiba are jointly developing the IC card camera, a still camera that uses NAND-type electrically erasable programmable read-only-memory (EEPROM) to store images instead of film. The IC camera is a true digital electronic still camera, unlike the Sony Mavica that stores analog signals on floppy disks. The developers have obtained image resolution of 400 horizontal lines vs 300 with conventional electronic cameras, but their goal is 430 lines. Also under development is an digital -audio-tape (DAT) image storage subsystem capable of holding up to 1,600 pictures on a 120-min DAT tape, a 16:1 signal compression technology and a 200...

DATA INNOVATIONS, INC. DEVELOPS THE FIRST DIGITAL CAMERA FOR USERS OF
PC-BASED CAD/CAE 2D/3D MODELING SYSTEMS
News Release September 10, 1987 p. 1

Data Innovations, Inc. has developed the computer industry's first digital camera (digital film recorder) that creates realistic print, slide or transparency reproductions of designs produced by IBM PC...

... extremely realistic features and details of computer-generated designs, such as solid models and shaded images. Designs are recorded onto high-quality instant color prints, 35mm slides or instant overhead-projection transparencies. High resolution prints, slides and overheads are generated independently of the computer system's graphics hardware. ModelViewer PC connects directly to IBM PC/XT/AT or compatibles and 386-based computers and shaded-image data files are transferred at standard PC bus speeds. Interfaces are available for AutoCAD, VersaCAD and Personal Designer software packages. Additional interfaces are currently under development.

RECORD TYPE: ABSTRACT

ABSTRACT: Digital photography combines traditional photographic technology with computers to convert images into digital form and store and edit them. Conventional silver-halide film images remain superior for some applications, but digital images often resemble film images so closely that differences are not noticeable. Digital cameras are often used by news services and are ideal for inserting graphics into computer documents; they are also well suited for developing an image library. Kodak's PhotoCD technology stores images on CD-ROM, but the disks are not yet compatible with existing CD drives. A digital camera uses charge coupled devices (CCDs) to collect images. True digital cameras combine microprocessors with the optics of a film camera, focusing an image onto a CCD instead of a roll of film. Still-video cameras use non-standard

2-inch floppy disks to store **image** data in analog format. True **digital** cameras are limited in resolution only by the density of the light-sensitive pixels on the CCD; sophisticated units offering high resolution are very costly. Guidelines for selecting a **digital** camera are included.

Photo Firm Develops Paperless System

Anonymous

Computerworld v16n13 PP: 49-50 Mar 29, 1982

ISSN: 0010-4841 JRNL CODE: COW

ABSTRACT: Although over 250,000 orders per year go through Eastman Kodak's regional distribution center at Rochester, New York, its order entry system uses both data and image processing indexing methods and is virtually paperless. There has been an estimated savings of 90% of...

... methods, as well as a saving of over \$12,000 in maintenance costs. The company receives and acts upon most orders electronically, however, it does receive or generate about 8,500 pieces of paper a day which are then keyed into...

... an IBM System/38 which perform parallel functions, but for different classes of trade. Customers receive a paper invoice from the main IBM computer, which also creates 2 magnetic tapes. One tape is used as an index to the invoice images which are created when the other tape is transferred to 16mm roll film by a computer-output microfilmer. Kodak's Information Services Division uses a distributed electronic filing method. The Division also maintains the only detailed record of customer transactions. ...

Polaroid Clicks Instantly in Moslem Market

Harper, Timothy

Advertising Age v57n8 PP: 12 Jan 30, 1986

ISSN: 0001-8899 JRNL CODE: ADA

...ABSTRACT: to carve out its markets in the region primarily through the special appeal of instant **photography** . Arabs were able to retain family privacy as film laboratories were not needed for **developing** . Eastman Kodak did mount a recent competitive challenge in the area with its less expensive instant camera and film . However, a January US district court decision has barred Kodak from the instant **photography** market due to patent violations. Nevertheless, Polaroid will continue its expansion plans, training **distributors** and sales clerks and using a marketing mix that respects each country's culture. Polaroid, with advertising **purchaser** Ogilvy & Mather Worldwide, opts for advertisements on local television and in the pan-Arabic press.

... media is shown in Figure 1. (Figure 1 omitted)

Today, document storage systems are both **digital** and **image** based. Documents **processed** by **camera** to **film** media must be **image** based, but their index in a computer-aided retrieval (CAR) system is often in a **digital** format and resides on magnetic media. Though CAR and related film systems continue to be viable, the trend is clearly toward **digital image** and text systems (Shaw, 1993). The fatal flaw with film systems is that the medium is not **digital**, and therefore it cannot be shared among multiple users and it cannot be telecommunicated or used on a **network** of users. Businesses that require the **digital** format can use special scanners to convert the film.

Documents that are scanned and converted...

Fun with Digitized Graphics

Cassing, Cass

PSA Journal (IPSA), v56 n6, p22-26

Jun 1990

ISSN: 0030-8277 JOURNAL CODE: IPSA

DOCUMENT TYPE: Feature

LANGUAGE: English

RECORD TYPE: Abstract

LENGTH: Long (31+ col inches)

ABSTRACT: Digitized **graphics** is analog data converted to a **digital** format that can be adjusted by the computer operator. Photographers who want to produce digitized **graphics** need a regular **camera**, **film**, **lenses**, a computer with the ability to copy **pictures** and a **processing** lab. Suggestions on digitizing are presented.

Digital imaging boom exploits technologies.
AUGMENTED TITLE: special report; cover story
Aviation Week & Space Technology (Aviat Week Space Technol) v. 140 (June 6 '94) p. 40-6+
LANGUAGE: English

ABSTRACT: A special report examines digital imaging in the aerospace industry. Digital imaging, formerly used in limited capacities in flight simulators and reconnaissance systems, is now being used throughout the aerospace industry. A revolution in microelectronics has provided the signal processing, memory storage, and communications technology that allow for wider uses of digitally stored and transmitted images. Film camera photographs still provide superior resolution and image quality, but digital cameras may emerge as the imaging systems of the future, according to Donald L. Light of the National Aerial Photography Program at the U.S. Geological Survey. Various digital imaging systems being used or tested by the military and other institutions are described. Related articles discuss the hardware challenges that digital imagery presents and the imagery advances required to create real-time targeting systems.

At Polaroid, big hopes for a smaller camera.
AUGMENTED TITLE: Captiva instant camera
Holusha, John
New York Times (Late New York Edition) (June 9 1993) p. D3
LANGUAGE: English

...ABSTRACT: the Polaroid Corporation announced the Captiva, a new, smaller instant camera that is meant to develop a new market. The Captiva is different from most Polaroid products in that it does not discharge pictures after the shutter is pressed but transports film inside the camera to a viewing area and container on the back. Polaroid officials say that the process would enable users to take subsequent pictures without having to find a place for the previously exposed shots. The company will begin...

...119-\$139, in July, and Polaroid officials say that the Captiva should be in full **distribution** by September.

TEXT:

Picturevision, a company founded by Israelis that developed technology to send **photographs** in the form of digital **images** via the Internet is set for an initial public offering (IPO) on Wall St. Three...

...sold 51 percent of it to Kodak in 1998 for \$100 million. Kodak has placed **Picturevision** in over 40,000 locations throughout North America and is expanding sites to Europe and the Far East. Major software programs from Microsoft's **Pictureit** to Adobe's **photoshops** use **Picturevision** technology. The sale of 51 percent of **Picturevision** by the Israelis to Kodak may have been premature. Today more than 3 million **photographs** a month are being sent by **Picturevision** using the Internet. Kodak is now in the process of issuing an IPO for **Picturevision** that will raise approximately \$500 million. The Israeli entrepreneurs who still own part of **Picturevision** are not too hurt, as all three are millionaires and can expect to **receive** many more millions from the IPO of **Picturevision**. It was wonderful for them that they had a vision and it may be good to get in on this **picture** too, when it comes to Wall St.

...A., 1999 FEB 18 (NB) -- By Matt Hines, Newsbytes. Philips Electronics and Eastman Kodak subsidiary **PictureVision** Inc. have established a new partnership aimed at delivering online digital photo applications over the television. Under the agreement, Philips will offer Kodak's PhotoNet online **image** service along with several of its set-top devices which let users view the Internet on traditional TVs. The PhotoNet service allows users to view, share and store **photos** , as well as order **image** reprints and enlargements, via the Internet. "This agreement supports two growing trends -- online interactive television and digital **photography** ," said Adrian Turner, director of Internet business development at Philips Electronics. "As a consumer platform, the television represents a natural vehicle for the display of digital **photographs** ." As part of the new relationship, **PictureVision** will develop a TV-based version of PhotoNet and Philips will make the service available on devices including its WebTV-based Internet **Receiver** which offers wireless access to a PC via the television. The two firms officially announced...

...The partners indicated that over three million camcorders with the interface have already been sold. **PictureVision** is an independently operated subsidiary of Eastman Kodak which focuses primarily on the digital **photography** services sector. **PictureVision** 's Web site is located at <http://www.picturevision.com> Philips can be found online at <http://www.phillips.com> Reported By Newsbytes News...

ABSTRACT: Digital photography combines traditional photographic technology with computers to convert images into digital form and store and edit them. Conventional silver-halide film images remain superior for some applications, but digital images often resemble film images so closely that differences are not noticeable. Digital cameras are often used by news services and are ideal for inserting graphics into computer documents; they are also well suited for developing an image library. Kodak's PhotoCD technology stores images on CD-ROM, but the disks are not yet compatible with existing CD drives. A digital camera uses charge coupled devices (CCDs) to collect images. True digital cameras combine microprocessors with the optics of a film camera, focusing an image onto a CCD instead of a roll of film. Still-video cameras use non-standard 2-inch floppy disks to store image data in analog format. True digital cameras are limited in resolution only by the density of the light-sensitive pixels on the CCD; sophisticated units offering high resolution are very costly. Guidelines for selecting a digital camera are included.

Transparency first

The way almost all computer **graphic images** end up in print is by being cast onto a transparency first. This computer generated **digital image** is converted to an analog film transparency. This transparency includes all the media artifacts of the **camera** and **film**; scan lines, chromatic and spherical aberrations, and film grain. Now this wonderfully crisp computer **image** saved on this fuzzy transparency goes to the color separator for prepress **processing**. What happens to this **image**? It gets scanned! What scan means is it gets converted back into a **digital** form so it can be plotted out to litho film separations. Because the scanners pick up all the film transparency distortions the value of computer **graphics** in print has been limited. The larger the **image** needs to be produced, the more obvious the distortions. Pick up any computer **graphics** magazine today and you will rarely see a full page computer **graphic image** --unless the **image** has been **digitally** separated by **Image-Set**.

So in the process of the image going from digital to analog film and

Photo CD 101

With Photo CD, Kodak found a way to drive **photography** into the **digital** world without having to **develop** new **camera** equipment and **film**. Kodak combined preexisting and new technology into a system that lets photo finishers store **processed** film in **digital** form on low-cost CD-ROMs.

In June 1992, Kodak released the Photo CD Imaging...

ABSTRACT: Eastman Kodak Co (Rochester, NY) introduces the Photo CD compact disk-based **digital** storage system for storing, displaying and editing **photographs** . Photofinishers employing the Kodak technology will offer customers the choice of having some or all of a **roll film** stored on a blank Photo CD in addition to usual slides or prints. Each Photo CD will hold up to 100 **images** at a cost of about \$20 for each 24 **photographs** . A microcomputer with an attached CA ROM XA drive can be used to view and edit the **photographs** . A special CD player will enable the **photographs** to be displayed on a television set. The commercial Photo CD photofinishing system will cost about \$100,000 and includes a Sun Microsystems workstation

and Kodak film scanner, **image** manipulation software and color thermal printer. The system and software **development** tools for applications **developers** will ship in 1992.
